

ABSTRACT

Collapsible lightweight, and portable cot type bed for pets and children. A spring  
biased horizontal connector pin can slidably attach bottom edges of vertical support legs  
5 to horizontal cross braces to maintain the cot in an assembled position that can support  
extreme amounts of weight. The horizontal pin can be connected to a bottom portion of a  
metal strip having an upper edge attached by rivets, soldering or welding to the vertical  
support legs. Sidewall panels along the planar support surface of the cot allow for  
keeping objects from sliding off the cot. A removable canopy or a removable hutch-like  
10 compartment for deflecting sun and providing shade when the cot is used outdoors can be  
mounted to the vertical legs above the planar support surface. The hutch-like  
compartment is made of flexible, lightweight materials and can be closed on all sides,  
using see-through or open weave materials for ventilation while securely containing a  
child or pet inside. The cot can be easily folded like an accordion and placed in a carrying  
15 bag and have a weight of less than approximately 15 pounds
